

LEXNET NETWORK DIAGNOSTICS PROGRAM

FOR SERIAL INTERFACES

LEXNet is a network management software tool created by Lexycom Technologies to keep the radio network operating at its maximum performance by providing real-time system information which allows the user to set up, monitor, manage, and make changes to the network without disrupting the entire radio system from its normal course of operation.

LEXNet Diagnostics software is designed to operate over a point-to-point, point-to-multi-point, or a TDMA network of Lexycom software defined data transceivers. All radios in the network can be polled or programmed with the software from either a slave or a master within the same network.

RELATED PRODUCTS

- **Interchangeable data interface boards and front panels**
- **Tlami-800, Tlami-800L transceivers**
- **Board level**
- **Antennas**
- **Cables**

Remotely set up, monitor, and manage an entire Network with LEXNet Diagnostics
